

Ex.No-5**Data Cleaning & Preparation (Excel file)****Aim**

To do the Data Cleaning and Preparation using Excel data.

Description:

Read the Excel file, do the data cleaning process and write the updated data set into excel file

1. Remove the white space using str.strip function
2. Fill the forward values for NaN using fillna(pad) method
3. Drop one particular column using drop function
4. Drop NaN rows using dropna function
5. Replace the values(s) using replace function
6. Extract the particular record based on the isin() function condition

PROGRAM:

```
import pandas as pd

pd.set_option('display.max_columns', 10)

print("Original data set from Excel file:\n")

df=pd.read_excel("d:\sample1.xlsx")

print(df)

f=df['NAME'].str.strip()

f.to_excel("D:\sample22.xlsx")

print("\nReplace value with Forward:\n")

k=df.fillna(method='pad')

print(k)

print("\nThe above updated data set will be stored in sample2.xlsx file....\n")

k.to_excel("d:\sample2.xlsx")

print("\nDrop one particular column and its values:\n")

k.drop(['TOTAL'],axis=1, inplace=True)

print(k)

print("\nThe above updated data set will be stored in sample3.xlsx file....\n")
```

```
k.to_excel("d:\sample3.xlsx")

print("\nDrop NaN rows:\n")
df=pd.read_excel("d:\sample4.xlsx")
print(df)
x=df.dropna()
print(x)
print("\nThe above updated data set will be stored in sample5.xlsx file....\n")
x.to_excel("d:\sample5.xlsx")

print("\nReplace values:\n")
n=pd.read_excel("d:\sample3.xlsx")
print("Original data set:\n");
print(n)
y=n.replace({49:50})
print("\nUpdated dataset with replaced values: {49:50}\n")
print(y)
print("\nThe above updated data set will be stored in sample6.xlsx file....\n")
y.to_excel("d:\sample6.xlsx")

print("Original data set from Excel file:\n")
df=pd.read_excel("d:\sample1.xlsx")
print(df)

print("\nExtract the particular record based on the isin() function condition:\n")
new=df['ENGLISH'].isin([49])
print(df[new])
```

OUTPUT:

Original data set from Excel file:
